Adaptive Load Sensing Adaptive Electro-hydraulic System for the Efficiency of Mobile Machines

The new Hydraulic Digital Solution product line

SAVE → **ALS** 5% +
RECOVER → **EPX** UP TO 20% =
SAVINGS + UP TO TOTAL ENERGY 25%

The modern mobile machinery market demands a constant increase in productivity and performance, together with lower operating costs, greater efficiency and reduced emissions in favor of sustainability and social responsibility.

Various research and studies in the field point out that up to 40% of the energy supplied to the hydraulic system of the operating machine is dissipated by the limited efficiency of the components and the pressure drops due to the metering and control of the movements.

The problem is even more evident on electrified applications, where energy efficiency is synonymous with prolonged range and reduced battery capacity.

Walvoil illustrates how to increase efficiency of the hydraulic system and its components with the new **Hydraulic Digital Solution** product line, which guarantees a consumption reduction up to 25%.

The Adaptive Load Sensing system

ALS is a synergistic set of components for the efficiency of mobile machines.

The joint control of the hydraulic directional control valve and the pump makes it possible to cut down pressure drops due to the pressure margins of the metering system.

At the same time, a series of logics are available to improve machine control, productivity, and driving comfort.

Walvoil offers three different ALS solutions to provide extreme versatility and adapt to the performance and system requirements of the machine.

In fact, the ALS system can be used as an integral part of the hydraulic directional control valve or fitted to the variable displacement pump.

Mobile Machines

L.S. Electronic Control

This solution enables to use Pressure Control functions paired with Flow Sharing directional control valves of the DPX and EPX series. The system manages and conditions the Load Sensing signal of the circuit in order to reduce consumption and optimize control.

Since the ALS system can be fitted directly to the directional control valve, its benefits can be enjoyed combined with fixed displacement pumps.

In case the DPX or EPX valve is connected to a variable displacement pump, the ALS regulator with Flow Control function, which, with this solution, provides the logic set by the operator and through the signals coming from the various sensors.

Hydraulic Digital Solution

Flow Control

Combined with a variable displacement pump, the flow control is integrated into the pump to provide a defined flow rate, both according to the target values defined through sensors.

The special feature of this configuration is the combination of a normal electro-proportional Open Center directional control valve with the electronically controlled variable displacement pump equipped with ALS logic.

The Variable displacement pump supplies the flow demand settled by the operator logic (dedicated software), accordingly with single or multiple operations. In this configuration the Flow on Demand Logic ensures better load metering and greater vehicle stability combined with a tangible reduction in fuel consumption.

The system is managed by an electronic control unit and specially developed software in the PHC STUDIO environment.

Features and operational functions

The main benefits of the ALS system are:

- Pressure Margin reduction both during operation and machine inactivity phases
- Definition of easily customizable control and sensitivity curves using PHC STUDIO software
- Definition of different operating conditions for maximizing control or productivity
- Dynamic torque and power limitation
- Greater utilization of installed power
- Less fluid heating
- Less instability and oscillations
- Customizable actuation modes for more comfortable driving

The ALS is also provided standard with some basic functions.

Precision function: reduces the Pressure Margin value, allowing to improve the accuracy and sensitivity of operation.

Boost function: temporarily increases the Pressure Margin value for higher speeds and productivity, without the need to install larger pumps.
